

Enhans PC-38

Koster Keunen chemists have taken our knowledge of wax chemistry and synthetic polymers to engineer this exclusive raw material. Our multiuse compound can be used to make unique textures and improve current formulas in anhydrous systems, such as lipsticks, cream to powders, foundations, and pencils.

The “Anti-Wax”

Enhans PC-38 will not act as a typical wax. It will not make a formula hard, brittle or act as the main structuring aid. PC-38 works to moderate the hardness of a system without decreasing your melt point while improving thermal stability. Formulators use this chemistry when typical waxy, occlusive properties are not desired.

Creamy Color Formulations

Enhans PC-38 is designed to reduce the crystallinity of formulations allowing for higher concentration usage that improves melt point without producing hard, brittle gel structures. Using PC-38 creates a low viscosity, creamy gel with a non-waxy skin feel. Formulas will have better pay-off, slip, silkiness and smooth textures. When a thicker product is required, PC-38 is highly compatible with other chemistries and waxes to achieve the desired viscosity.

Comfortable Cosmetics

Enhans PC-38 is used for its superior film forming properties in color cosmetics without causing drying or drag. This chemistry creates creamy gels with high slip, a non-waxy skin feel, and adjustable viscosity. PC-38 is a high melting point, non-crystalline wax known to improve stability and textures.

- ◆ Create many unique textures
- ◆ Regulate hardness & deposition
- ◆ Creamy and melt on skin sensation achievable
